Credit Name:CSE 2110 - Procedural Programming 1
Assignment Name:

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I wasn't completely sure what to put in my method. So I read the exercise a few more times and relized what I had to put in the method to make my program work

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I brainstormed how I was gonna make everything work and I relized i wasn't really sure on everything I needed to use. so I started off with everything in my main method because I knew for sure what was gonna be in there, then I could use my main method to help determine the type of method I was gonna use for my sum and if it was going to return something or not.

```
public static void main(String[] args) {

    Scanner input = new Scanner(System.in);

    System.out.println("Enetr All Your Coins");
    System.out.println("Quarters: ");
    int Quarters = input.nextInt();

    System.out.println("Dimes: ");
    int Dimes = input.nextInt();

    System.out.println("Nickles: ");
    int Nickles = input.nextInt();

    System.out.println("Pennies: ");
    int Pennies = input.nextInt();

    double Quarters2 = Quarters * 0.25;

    double Dimes2 = Dimes * 0.10;

    double Nickles2 = Nickles * 0.05;

    double Pennies2 = Pennies * 0.01;

    double dollarAmount = getDo(canAmount( Quarters2, Dimes2, Nickles2, Pennies2);

    System.out.print("total: $" + dollarAmount);
}
```

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

As I stated before I worked on everything in my main method first as I had an idea what was going to be in there. I used extra code to make sure that my programed worked that I was going to delete after used. Then I worked on the sum method and since I made sure everything in my main method was right I knew that if I had an error it was in my sum method becuase I already checked my main method

```
System.out.println(Quarters2);
System.out.println(Dimes2);
System.out.println(Nickles2);
System.out.println(Pennies2);
```

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

My program was not outputing the correct amount of dollars, I was confused so I asked Marcus and he told me because all my cents were in an integer type, so I switched all of those and it still was not working so I asked Marcus again and he did not know, so I asked ai and it told me that The problem is that Java is doing integer division for my caluculations, which was messing with the total, so I fixed my mistake and the program started working again.

Learning

Was there anything you learned that you think will help you with future challenges?

Java is very picky about how u word your equations correctly. So spend more time checking the logical errors of my projects
